AEGIS
SECURE PRO

Autonomous Multi-Stream Face Recognition Platform

Hybrid AI Architecture: YuNet Detection + ArcFace Embeddings

Aegis Secure Pro is a four-channel face recognition platform that identifies real authorized personnel and non-authorized people in real time across warehouses, laboratories, stores, factories, residential complexes, and data centers. Built on a hybrid AI architecture; combining ultra-fast face detection with state-of-the-art biometric embeddings. It operates entirely offline: no cloud, no internet, no data leaks.

Why Choose Aegis Secure Pro?

Total Offline and Information Privacy
No internet, cloud server required. No subscription fees needed. All data stays in local storage. Ideal for environments with strict data-security requirements.

New Generation AI and Deep Learning
YuNet ONNX for ultra-fast face detection, paired with ArcFace (InsightFace) for high-precision biometric matching (Hybrid Architecture). Models trained on millions of faces for highly accurate results.

4 Simultaneous Cameras (Full Environment Coverage)
Processes up to four camera feeds in parallel: IP cameras, CCTV, commercial cameras (via USB), or pre-recorded video files.
(NO INFRA-RED CAMERA NEEDED)

Anti-Spoofing (Built-in)
Optics-based intelligent liveness detection (Laplacian texture and FFT frequency analysis) to neutralize deceptive attempts (printed photos or videos on phone screens). No special hardware needed.

Architectural Highlights

Instant Enrollment
Register a new person with a few photos. The system learns their face and adds them to the local database; no cloud round-trip, no waiting.

Real-Time Performance
GPU-accelerated processing. Live streams stay smooth at 30 FPS while recognition runs across 4 channels in the background.

Event Logging
Triggers an immediate alert when a non-allowed presence is detected. Automatically logs the date, time, and camera ID in a secure local SQLite database for follow-up and reporting.

Scientific and Practical Rigor (Optical Physics Ph.D.)
Designed by ***a Ph.D. in Optics & Laser Physics***. Ensuring physical and mathematical precision, algorithmic quality, and expert system support.

How It Works

Step 1- Enrolling People

Take photos of each authorized person from different angles, positions, with and without glasses, masks, etc.

Step 2- Camera Definition

Insert the URL of each camera and they will be defined for further processing.

Sample Enrolled Profiles

With photos at different angles from each allowed person, with different poses and add-ons (mask, glasses, etc) that person will be defined on the database. It can be done for multiple people.

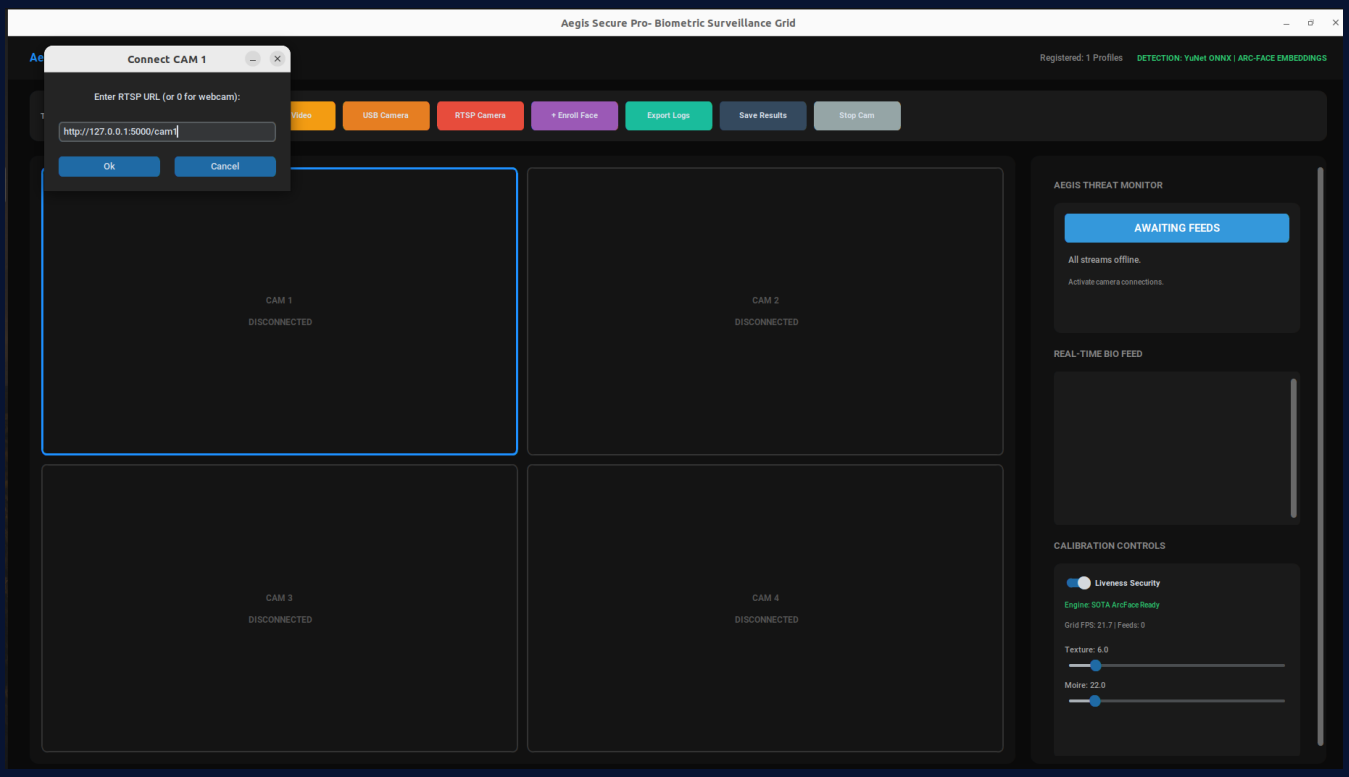

Front | Left | Right | Up | Down | Side

*Here **Yuseph** is defined as authorized personnel.*

Introducing security cameras with URL

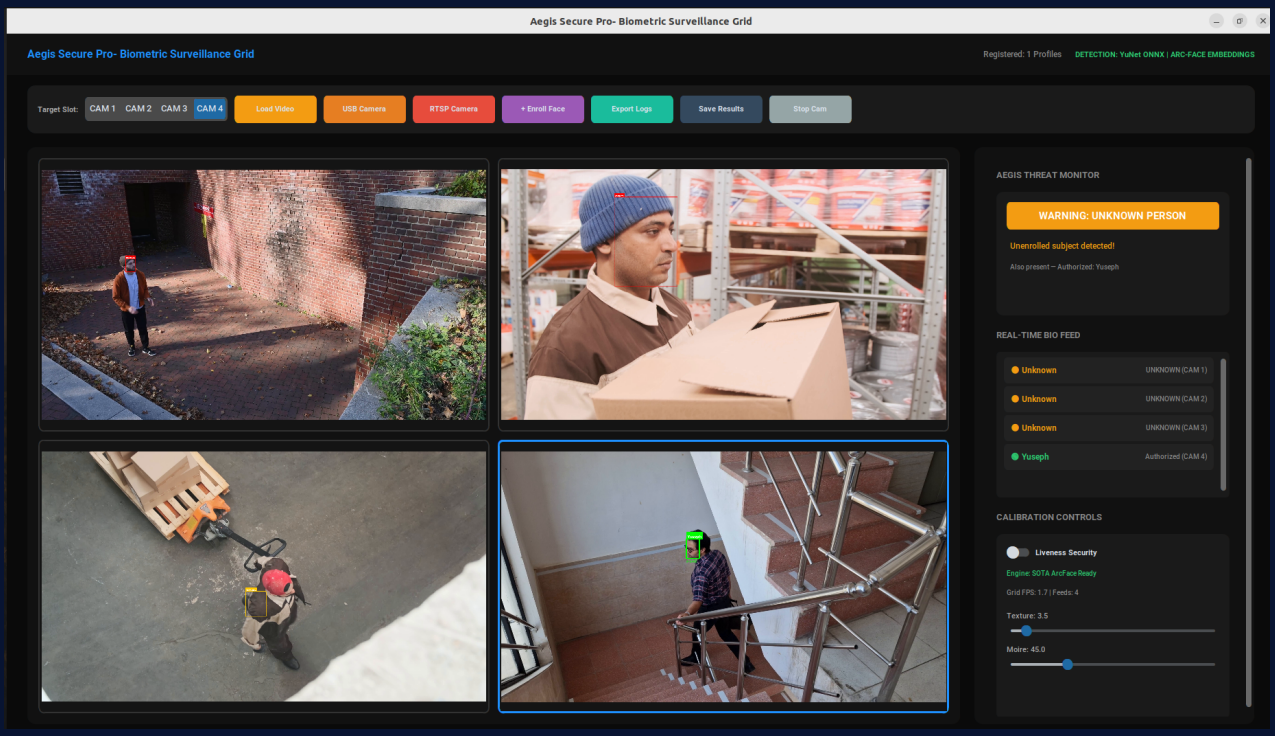

Each desired camera will be defined inserting its corresponding URL.

It can be done for up to 4 cameras. As it can be seen, instead of each camera, a previously recorded video, the webcam, or the USB of a local commercial camera can be defined.

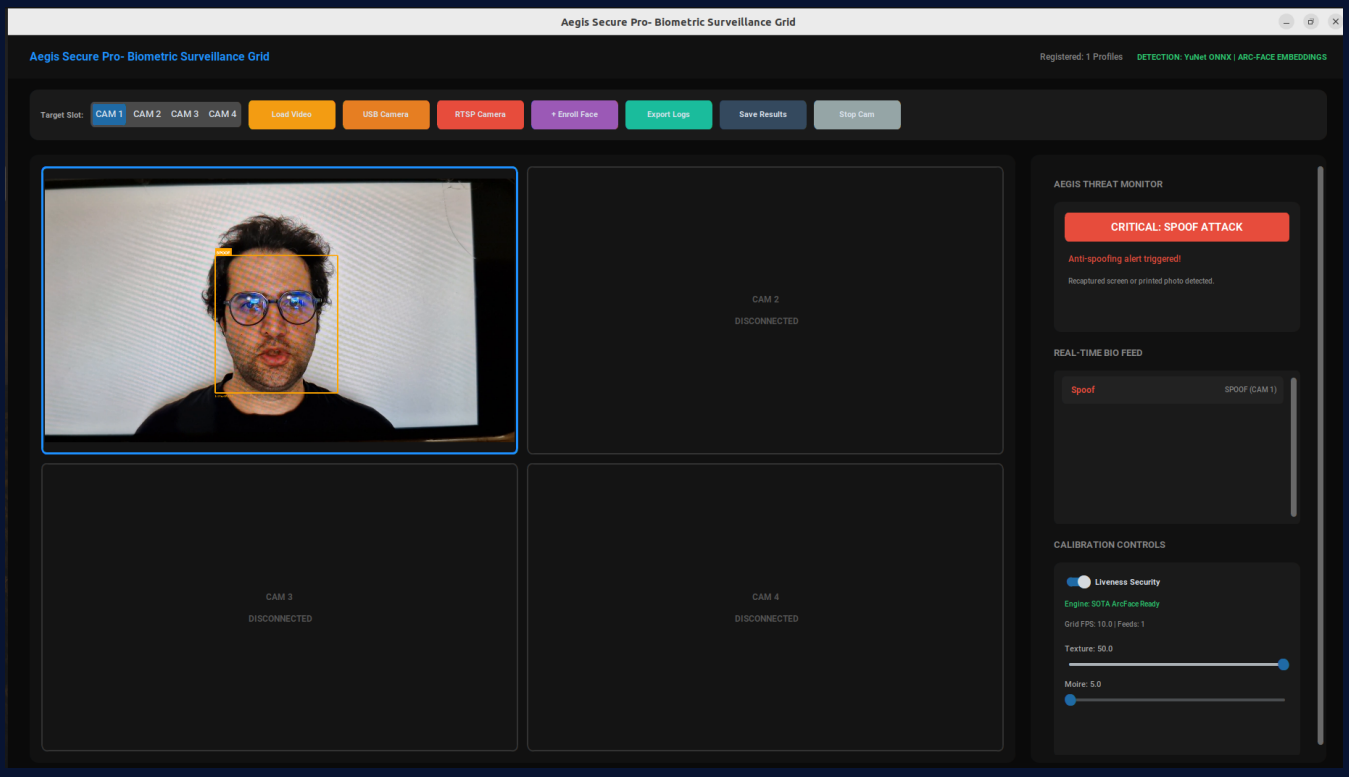

▶ Real-Time Face Recognition (Sample Outputs)

Once enrolled people are taken in the camera, a green theme comes to the scene. Detecting unknown people would make an alert with multiple beeps. If an intruder attempts to deceive the security camera by showing a printed or recorded image or video of an allowed person, the condition is declared as a SPOOF ATTACK with a continuous beep.

In the image, all 3 channels are reported with Unknown, while on the fourth channel, ***Yuseph*** *has been recognized as an authorized person.*

Here, an intruder has recorded a video of **Yuseph** and is showing it to a security camera. **Liveness Security** is supposed to detect this attack.

The alarm named SPOOF ATTACK with a red theme means that the attack has been detected and an alarm has been triggered with a continuous beep.

About Our Team & Services

Our Team & Leadership

Yusef Alvandi, Ph.D.

Optics & Laser Physics
Image Processing, Computer Vision & AI Specialist
Bridging Optics with advanced Deep Learning R&D.

Services

Custom Computer Vision for industry: Tailored image-processing and AI solutions for security and industrial challenges.
Model Development & Support: Model training, fine-tuning, and direct technical consultation, with solutions tailored to your needs and budget.
